Kapitel 1

Hierarchie-Verzeichnis

1.1 Klassenhierarchie

Die Liste der Ableitungen ist -mit Einschränkungen- alphabetisch sortiert:

CCalendar	7
CCalendar360	9
CCalendarNormal	10
CDate	12
CDateDiff	20
MonthInfo	32
OfficialHolidays	34
GermanyOfficialHolidays	22

Kapitel 2

Klassen-Verzeichnis

2.1 Auflistung der Klassen

Hier folgt die Aufzählung aller Klassen, Strukturen, Varianten und Schnittstellen mit einer Kurzbeschreibung:

CCalendar	7
CCalendar360	9
CCalendarNormal	10
CDate	12
CDateDiff	20
GermanyOfficialHolidays	22
MonthInfo	32
OfficialHolidays	34

Kapitel 3

Datei-Verzeichnis

3.1 Auflistung der Dateien

Hier folgt die Aufzählung aller Dateien mit einer Kurzbeschreibung:

src/ CDate.c	38
src/ CDateDiff.c	39
src/Calendar/ CCalendar.c	37
src/Calendar/ CCalendar360.c	37
src/Calendar/ CCalendarNormal.c	38
src/Holidays/ GermanyOfficialHolidays.c	39
src/Holidays/ OfficialHolidays.c	39
src/Util/ MonthInfo.c	40

Kapitel 4

Klassen-Dokumentation

4.1 CCalendar Klassenreferenz

Klassendiagramm für CCalendar:

Private Methoden

- public bool **isLeapYear** (int _year)
- abstract public int **getNumberOfDaysInMonth** (int _month, int _year)

4.1.1 Ausführliche Beschreibung

Base class for calendars that provides methods to fetch information about months in specified years.

Call **isLeapYear()** to check whether a specified year is a leap year or not Call **getNumberOfDaysInMonth()** to fetch the number that the specified month has in the specified year

4.1.2 Dokumentation der Elementfunktionen

4.1.2.1 getNumberOfDaysInMonth()

```
abstract public int CCalendar::getNumberOfDaysInMonth (
    int _month,
    int _year ) [private], [pure virtual]
```

Returns the number of days in a specified month.

Parameter

<code>_month</code>	The month number (0 = January, 11 = December)
<code>_year</code>	The year number to check for leap year

Rückgabe

int The number of days in the month

Implementiert in [CCalendarNormal](#) und [CCalendar360](#).

4.1.2.2 isLeapYear()

```
public bool CCalendar::isLeapYear (
    int _year ) [inline], [private]
```

Returns whether a specified year is a leap year.

Parameter

<code>_year</code>	The year to check
--------------------	-------------------

Rückgabe

bool True if the year is a leap year, false otherwise

This function was taken from <http://www.keentpoint.com/programming/examples/csharp/Program-To-Check-Leap-Year>

Die Dokumentation für diese Klasse wurde erzeugt aufgrund der Datei:

- `src/Calendar/CCalendar.c`

4.2 CCalendar360 Klassenreferenz

Klassendiagramm für CCalendar360:

Zusammengehörigkeiten von CCalendar360:

Private Methoden

- public override int [getNumberOfDaysInMonth](#) (int _month, int _year)

4.2.1 Ausführliche Beschreibung

Represents the bank calendar with 30 days per month and 360 days per year.

4.2.2 Dokumentation der Elementfunktionen

4.2.2.1 getNumberOfDaysInMonth()

```
public override int CCalendar360::getNumberOfDaysInMonth (
    int _month,
    int _year ) [inline], [private], [virtual]
```

Returns the number of days in a specified month.

Parameter

<code>_month</code>	The month number (0 = January, 11 = December)
<code>_year</code>	The year number to check for leap year

Rückgabe

int The number of days in the month

Implementiert [CCalendar](#).

Die Dokumentation für diese Klasse wurde erzeugt aufgrund der Datei:

- `src/Calendar/CCalendar360.c`

4.3 CCalendarNormal Klassenreferenz

Klassendiagramm für CCalendarNormal:

Zusammengehörigkeiten von CCalendarNormal:

Private Methoden

- public override int [getNumberOfDaysInMonth](#) (int _month, int _year)

Statische, private Attribute

- static private int [] [daysPerMonth](#) = new int[]{31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31}

4.3.1 Ausführliche Beschreibung

Represents the normal 365 days calendar.

4.3.2 Dokumentation der Elementfunktionen

4.3.2.1 getNumberOfDaysInMonth()

```
public override int CCalendarNormal::getNumberOfDaysInMonth (
    int _month,
    int _year ) [inline], [private], [virtual]
```

Returns the number of days in a specified month.

Parameter

<code>_month</code>	The month number (0 = January, 11 = December)
<code>_year</code>	The year number to check for leap year

Rückgabe

int The number of days in the month

Implementiert [CCalendar](#).

4.3.3 Dokumentation der Datenelemente

4.3.3.1 daysPerMonth

```
CCalendarNormal::daysPerMonth = new int[ ]{31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31}
[static], [private]
```

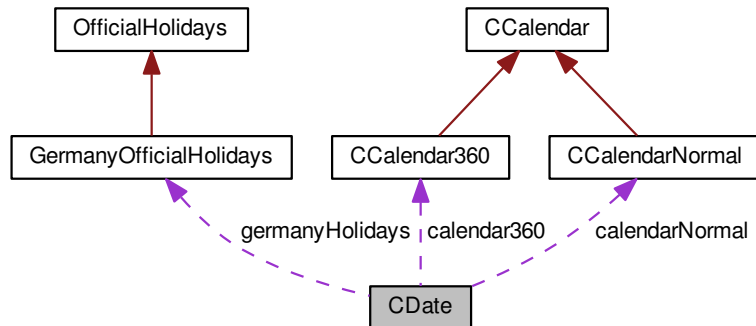

The list of days per month.

Die Dokumentation für diese Klasse wurde erzeugt aufgrund der Datei:

- src/Calendar/[CCalendarNormal.c](#)

4.4 CDate Klassenreferenz

Zusammengehörigkeiten von CDate:

Private Methoden

- public [CDate](#) (int _day, int _month, int _year)
- public [CDate](#) ([CDate](#) _date)
- private void [validateDate](#) (int _day, int _month, int _year)
- private int [getNumberOfDaysExceededForMonthInCalendar](#) ([CCalendar](#) _calendar)
- public int [dayNumber](#) ()
- public int [monthNumber](#) ()
- public int [yearNumber](#) ()
- public int [compareTo](#) ([CDate](#) _otherDate)
- public void [addDays](#) (int _numberOfDays)
- private void [addMonths](#) (int _numberOfMonths)
- public [CDateDiff](#) [diffNormal](#) ([CDate](#) _otherDate)
- public [CDateDiff](#) [diff360](#) ([CDate](#) _otherDate)
- private [CDateDiff](#) [diff](#) ([CDate](#) _otherDate, [CCalendar](#) _calendar)
- public int [getDayOfWeek](#) ()
- public bool [isOfficialHoliday](#) ()
- public string [toFormattedString](#) (string _formatString)
- public double [toJulianDate](#) ()
- public string [toString](#) ()

Private Attribute

- public const int [COMPARESTATUS_LOWER_THAN_COMPARISON_DATE](#) = 1
- public const int [COMPARESTATUS_EQUAL_TO_COMPARISON_DATE](#) = 0
- public const int [COMPARESTATUS_HIGHER_THAN_COMPARISON_DATE](#) = -1
- private int [day](#)
- private int [month](#)
- private int [year](#)

Statische, private Attribute

- static private `CCalendarNormal calendarNormal` = new `CCalendarNormal()`
- static private `CCalendar360 calendar360` = new `CCalendar360()`
- static private `GermanyOfficialHolidays germanyHolidays` = new `GermanyOfficialHolidays()`

4.4.1 Ausführliche Beschreibung

Stores a date and provides various util methods to fetch information about the date and to compare it to other dates.

4.4.2 Beschreibung der Konstruktoren und Destruktoren

4.4.2.1 CDate() [1/2]

```
public CDate::CDate (
    int _day,
    int _month,
    int _year ) [inline], [private]
```

`CDate` constructor.

Parameter

<code>_day</code>	The day number
<code>_month</code>	The month number
<code>_year</code>	The year number

Ausnahmebehandlung

<i>Exception</i>	The Exception when the specified date is invalid
------------------	--

4.4.2.2 CDate() [2/2]

```
public CDate::CDate (
    CDate _date ) [inline], [private]
```

Copy constructor.

Parameter

<code>_date</code>	The date to copy
--------------------	------------------

4.4.3 Dokumentation der Elementfunktionen

4.4.3.1 addDays()

```
public void CDate::addDays (
    int _numberOfDays ) [inline], [private]
```

Adds a number of days to this [CDate](#).

Parameter

<code>_numberOfDays</code>	The number of days to add
----------------------------	---------------------------

4.4.3.2 addMonths()

```
private void CDate::addMonths (
    int _numberOfMonths ) [inline], [private]
```

Adds a number of months to this [CDate](#).

Parameter

<code>_numberOfMonths</code>	The number of months to add
------------------------------	-----------------------------

4.4.3.3 compareTo()

```
public int CDate::compareTo (
    CDate _otherDate ) [inline], [private]
```

Returns the comparison status to a different [CDate](#).

Parameter

<code>_otherDate</code>	The comparison date
-------------------------	---------------------

Rückgabe

int The comparison status (one of the COMPARESTATUS_* constants)

4.4.3.4 dayNumber()

```
public int CDate::dayNumber ( ) [inline], [private]
```

Returns the day nubmer of this date.

Rückgabe

int The day number

4.4.3.5 diff()

```
private CDateDiff CDate::diff (
    CDate _otherDate,
    CCalendar _calendar ) [inline], [private]
```

Calculates and returns the difference to another date in a specified calendar.

Parameter

<code>_otherDate</code>	The date to compare this date to
<code>_calendar</code>	The calendar to use for the comparison

Rückgabe

CDateDiff The difference to the other date

4.4.3.6 diff360()

```
public CDateDiff CDate::diff360 (
    CDate _otherDate ) [inline], [private]
```

Returns the difference to another date using the bank calendar.

Parameter

<code>_otherDate</code>	The date to compare this date to
-------------------------	----------------------------------

Rückgabe

CDateDiff The difference to the other date

4.4.3.7 diffNormal()

```
public CDateDiff CDate::diffNormal (
    CDate _otherDate ) [inline], [private]
```

Returns the difference to another date using the regular calendar.

Parameter

<code>_otherDate</code>	The date to compare this date to
-------------------------	----------------------------------

Rückgabe

`CDateDiff` The difference to the other date

4.4.3.8 getDayOfWeek()

```
public int CDate::getDayOfWeek ( ) [inline], [private]
```

Returns the day of the week of this date.

Rückgabe

`int` The day of the week

4.4.3.9 getNumberOfDaysExceededForMonthInCalendar()

```
private int CDate::getNumberOfDaysExceededForMonthInCalendar (
    CCalendar _calendar ) [inline], [private]
```

Returns the number of days by which the month of this date in a specified calendar is exceeded by this date's day.

Parameter

<code>_calendar</code>	The calendar to check
------------------------	-----------------------

Rückgabe

`int` The number of days by which the month is exceeded

4.4.3.10 isOfficialHoliday()

```
public bool CDate::isOfficialHoliday ( ) [inline], [private]
```

Returns whether this date is an official holiday.

Rückgabe

bool True if this date is an official holiday, false otherwise

4.4.3.11 monthNumber()

```
public int CDate::monthNumber ( ) [inline], [private]
```

Returns the month number of this date.

Rückgabe

int The month number

4.4.3.12 toFormattedString()

```
public string CDate::toFormattedString (
    string _formatString ) [inline], [private]
```

Returns this date as a formatted string.

The following format specifiers are available:

- d = day number
- m = month number
- y = year number
- F = full month name
- M = short month name

You may add ":<zeros>.<zeros>" to define by how many zeros the numbers must be padded (usage is the same as in String.Format output variable specifiers).

Parameter

<code>_formatString</code>	The format string
----------------------------	-------------------

Rückgabe

string The formatted date string

4.4.3.13 toJulianDate()

```
public double CDate::toJulianDate ( ) [inline], [private]
```

Returns the julian date that equals this gregorian date. Using the algorithm from here: https://de.wikipedia.org/wiki/Julianisches_Datum#Umrechnung_Kalenderdatum_%E2%86%92_JD

Rückgabe

double The julian date

4.4.3.14 toString()

```
public string CDate::toString ( ) [inline], [private]
```

Returns this date as a string in the format "DD.MM.YYYY".

Rückgabe

string This date as a string

4.4.3.15 validateDate()

```
private void CDate::validateDate (
    int _day,
    int _month,
    int _year ) [inline], [private]
```

Validates a date.

Parameter

<i>_day</i>	The day number (0 - 30)
<i>_month</i>	The month number (0 = January, 11 = December)
<i>_year</i>	The year number

Ausnahmebehandlung

<i>Exception</i>	The Exception when the specified date is invalid
------------------	--

4.4.3.16 yearNumber()

```
public int CDate::yearNumber ( ) [inline], [private]
```

Returns the year number of this date.

Rückgabe

int The year number

4.4.4 Dokumentation der Datenelemente

4.4.4.1 calendar360

```
private CCalendar360 CDate::calendar360 = new CCalendar360() [static], [private]
```

4.4.4.2 calendarNormal

```
private CCalendarNormal CDate::calendarNormal = new CCalendarNormal() [static], [private]
```

4.4.4.3 COMPARESTATUS_EQUAL_TO_COMPARISON_DATE

```
public const int CDate::COMPARESTATUS_EQUAL_TO_COMPARISON_DATE = 0 [private]
```

4.4.4.4 COMPARESTATUS_HIGHER_THAN_COMPARISON_DATE

```
public const int CDate::COMPARESTATUS_HIGHER_THAN_COMPARISON_DATE = -1 [private]
```

4.4.4.5 COMPARESTATUS_LOWER_THAN_COMPARISON_DATE

```
public const int CDate::COMPARESTATUS_LOWER_THAN_COMPARISON_DATE = 1 [private]
```

4.4.4.6 day

```
private int CDate::day [private]
```

4.4.4.7 germanyHolidays

```
private GermanyOfficialHolidays CDate::germanyHolidays = new GermanyOfficialHolidays() [static],  
[private]
```

4.4.4.8 month

```
private int CDate::month [private]
```

4.4.4.9 year

```
private int CDate::year [private]
```

Die Dokumentation für diese Klasse wurde erzeugt aufgrund der Datei:

- src/[CDate.c](#)

4.5 CDateDiff Klassenreferenz

Private Methoden

- public [CDateDiff](#) (bool _isNegative, int _days, int _months, int _years)
- public string [toString](#) ()

Private Attribute

- private bool [isNegative](#)
- private int [days](#)
- private int [months](#)
- private int [years](#)

4.5.1 Ausführliche Beschreibung

Stores the result for a detailed date difference.

4.5.2 Beschreibung der Konstruktoren und Destruktoren

4.5.2.1 CDateDiff()

```
public CDateDiff::CDateDiff (
    bool _isNegative,
    int _days,
    int _months,
    int _years ) [inline], [private]
```

Constructs a new [CDateDiff](#).

Parameter

<code>_isNegative</code>	True if the difference is negative, false if it is positive
<code>_days</code>	The number of days
<code>_months</code>	The number of months
<code>_years</code>	The number of years

4.5.3 Dokumentation der Elementfunktionen

4.5.3.1 toString()

```
public string CDateDiff::toString ( ) [inline], [private]
```

Generates and returns a string from the information stored in this date difference.

Rückgabe

string The generated string

4.5.4 Dokumentation der Datenelemente

4.5.4.1 days

```
int CDateDiff::days [private]
```

The number of days of the difference

4.5.4.2 isNegative

```
bool CDateDiff::isNegative [private]
```

True if the date difference is negative (-), false if it is positive (+)

4.5.4.3 months

```
int CDateDiff::months [private]
```

The number of months of the difference

4.5.4.4 years

```
int CDateDiff::years [private]
```

The number of years of the difference

Die Dokumentation für diese Klasse wurde erzeugt aufgrund der Datei:

- [src/CDateDiff.c](#)

4.6 GermanyOfficialHolidays Klassenreferenz

Klassendiagramm für GermanyOfficialHolidays:

Zusammengehörigkeiten von GermanyOfficialHolidays:

Private Methoden

- public override string `getDayOfficialHolidayName` (CDate _date)
- public bool `isNewYearsDay` (CDate _date)
- public bool `isEpiphany` (CDate _date)
- public bool `isInternationalWomenDay` (CDate _date)
- public bool `isDayOfWork` (CDate _date)
- public bool `isPeaceOfAugsburgDay` (CDate _date)
- public bool `isAssumptionOfMaryDay` (CDate _date)
- public bool `isGermanUnificationDay` (CDate _date)
- public bool `isReformationDay` (CDate _date)
- public bool `isAllHallowsDay` (CDate _date)
- public bool `isFirstChristmasDay` (CDate _date)
- public bool `isSecondChristmasDay` (CDate _date)
- public bool `isSylvester` (CDate _date)
- public bool `isEaster` (CDate _date, CDate _easterDate)
- public bool `isEasterMonday` (CDate _date, CDate _easterDate)
- public bool `isGoodFriday` (CDate _date, CDate _easterDate)
- public bool `isAscensionOfChristDay` (CDate _date, CDate _easterDate)
- public bool `isWhitsunday` (CDate _date, CDate _easterDate)
- public bool `isWhitmonday` (CDate _date, CDate _easterDate)
- public bool `isCorpusChristiDay` (CDate _date, CDate _easterDate)
- private CDate `calculateEasterDate` (int _year)
- public bool `isDayOfRepentance` (CDate _date)

4.6.1 Ausführliche Beschreibung

Provides all official holidays in germany. Does not differentiate between federal states (e.g. Hessen, Bayern, etc.)

This list was used to determine all official holidays: <https://www.ferienwiki.de/feiertage/2019/de>

4.6.2 Dokumentation der Elementfunktionen

4.6.2.1 calculateEasterDate()

```
private CDate GermanyOfficialHolidays::calculateEasterDate (
    int _year ) [inline], [private]
```

Returns the date of Easter for a specified year. This was copied from https://de.wikibooks.org/wiki/Algorithmensammlung:_Kalender:_Feiertage.

Parameter

<code>_year</code>	The year to calculate the Easter date for
--------------------	---

Rückgabe

`CDate` The date of easter

4.6.2.2 getDayOfficialHolidayName()

```
public override string GermanyOfficialHolidays::getDayOfficialHolidayName (
    CDate _date ) [inline], [private], [virtual]
```

Returns the official holiday name for a specified date. Will return an empty string if there is no official holiday on that date.

Parameter

<code>_date</code>	The date to fetch the official holiday name for
--------------------	---

Rückgabe

string The official holiday name

Implementiert `OfficialHolidays`.

4.6.2.3 isAllHallowsDay()

```
public bool GermanyOfficialHolidays::isAllHallowsDay (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is all hallows day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is all hallows day, false otherwise

4.6.2.4 isAscensionOfChristDay()

```
public bool GermanyOfficialHolidays::isAscensionOfChristDay (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is ascension of christ day.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is ascension of christ day, false otherwise

4.6.2.5 isAssumptionOfMaryDay()

```
public bool GermanyOfficialHolidays::isAssumptionOfMaryDay (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is assumption of mary day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is assumption of mary day, false otherwise

4.6.2.6 isCorpusChristiDay()

```
public bool GermanyOfficialHolidays::isCorpusChristiDay (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is corpus christi day.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is corpus christi day, false otherwise

4.6.2.7 isDayOfRepentance()

```
public bool GermanyOfficialHolidays::isDayOfRepentance (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is day of repentance. This method is based on the logic of https://de.wikipedia.org/wiki/Algorithmensammlung:_Kalender:_Feiertage

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is day of repentance, false otherwise

4.6.2.8 isDayOfWork()

```
public bool GermanyOfficialHolidays::isDayOfWork (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is day of work.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is day of work, false otherwise

4.6.2.9 isEaster()

```
public bool GermanyOfficialHolidays::isEaster (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is easter sunday.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is easter sunday, false otherwise

4.6.2.10 isEasterMonday()

```
public bool GermanyOfficialHolidays::isEasterMonday (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is easter monday.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is easter monday, false otherwise

4.6.2.11 isEpiphany()

```
public bool GermanyOfficialHolidays::isEpiphany (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is epiphany day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is epiphany day, false otherwise

4.6.2.12 isFirstChristmasDay()

```
public bool GermanyOfficialHolidays::isFirstChristmasDay (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is first christmas day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is first christmas day, false otherwise

4.6.2.13 isGermanUnificationDay()

```
public bool GermanyOfficialHolidays::isGermanUnificationDay (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is german unification day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is german unification day, false otherwise

4.6.2.14 isGoodFriday()

```
public bool GermanyOfficialHolidays::isGoodFriday (  
    CDate _date,  
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is good friday.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is good friday, false otherwise

4.6.2.15 isInternationalWomenDay()

```
public bool GermanyOfficialHolidays::isInternationalWomenDay (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is international women day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is international women day, false otherwise

4.6.2.16 isNewYearsDay()

```
public bool GermanyOfficialHolidays::isNewYearsDay (  
    CDate _date ) [inline], [private]
```

Returns whether a specified date is new years day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is new years day, false otherwise

4.6.2.17 isPeaceOfAugsburgDay()

```
public bool GermanyOfficialHolidays::isPeaceOfAugsburgDay (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is peace of augsburg day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is peace of augsburg day, false otherwise

4.6.2.18 isReformationDay()

```
public bool GermanyOfficialHolidays::isReformationDay (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is reformation day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is reformation day, false otherwise

4.6.2.19 isSecondChristmasDay()

```
public bool GermanyOfficialHolidays::isSecondChristmasDay (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is second christmas day.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is second christmas day, false otherwise

4.6.2.20 isSylvester()

```
public bool GermanyOfficialHolidays::isSylvester (
    CDate _date ) [inline], [private]
```

Returns whether a specified date is sylvester.

Parameter

<code>_date</code>	The date to check
--------------------	-------------------

Rückgabe

bool True if the date is sylvester, false otherwise

4.6.2.21 isWhitmonday()

```
public bool GermanyOfficialHolidays::isWhitmonday (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is whit monday.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is whit monday, false otherwise

4.6.2.22 isWhitsunday()

```
public bool GermanyOfficialHolidays::isWhitsunday (
    CDate _date,
    CDate _easterDate ) [inline], [private]
```

Returns whether a specified date is whit sunday.

Parameter

<code>_date</code>	The date to check
<code>_easterDate</code>	The easter date for the date's year

Rückgabe

bool True if the date is whit sunday, false otherwise

4.7 MonthInfo Klassenreferenz

Private Methoden

- public [MonthInfo](#) (int `_monthNumber`)
- public string [getFullName](#) ()
- public string [getShortName](#) ()

Private Attribute

- private int [month](#)

Statische, private Attribute

- static private string [] [fullMonthNames](#)
- static private string [] [shortMonthNames](#)

4.7.1 Ausführliche Beschreibung

Util class that returns information about a month.

4.7.2 Beschreibung der Konstruktoren und Destruktoren

4.7.2.1 MonthInfo()

```
public MonthInfo::MonthInfo (  
    int _monthNumber ) [inline], [private]
```

Constructs a new [MonthInfo](#).

Parameter

<code>_monthNumber</code>	The month number to provide information for
---------------------------	---

4.7.3 Dokumentation der Elementfunktionen

4.7.3.1 `getFullName()`

```
public string MonthInfo::getFullName ( ) [inline], [private]
```

Returns the full month name for the target month.

Rückgabe

string The full month name

4.7.3.2 `getShortName()`

```
public string MonthInfo::getShortName ( ) [inline], [private]
```

Returns the short month name for the target month.

Rückgabe

string The short month name

4.7.4 Dokumentation der Datenelemente

4.7.4.1 `fullMonthNames`

```
MonthInfo::fullMonthNames [static], [private]
```

Initialisierung:

```
= {  
    "Januar", "Februar", "März", "April", "Mai", "Juni", "Juli", "August", "September", "Oktober", "  
    November", "Dezember"  
}
```

The list of full month names.

4.7.4.2 month

```
int MonthInfo::month [private]
```

The month number for which this [MonthInfo](#) will provide information (0 = January, 11 = December)

4.7.4.3 shortMonthNames

```
MonthInfo::shortMonthNames [static], [private]
```

Initialisierung:

```
= {  
    "Jan", "Feb", "Mär", "Apr", "Mai", "Jun", "Jul", "Aug", "Sep", "Okt", "Nov", "Dez"  
}
```

The list of short month names.

4.8 OfficialHolidays Klassenreferenz

Klassendiagramm für OfficialHolidays:

Private Methoden

- abstract public string [getDayOfficialHolidayName](#) (CDate _date)

4.8.1 Ausführliche Beschreibung

Util class to fetch official holiday names for specified dates.

4.8.2 Dokumentation der Elementfunktionen

4.8.2.1 getDayOfficialHolidayName()

```
abstract public string OfficialHolidays::getDayOfficialHolidayName (
    CDate _date ) [private], [pure virtual]
```

Returns the official holiday name for a specified date. Will return an empty string if there is no official holiday on that date.

Parameter

<code>_date</code>	The date to fetch the official holiday name for
--------------------	---

Rückgabe

string The official holiday name

Implementiert in [GermanyOfficialHolidays](#).
